No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                             The sequences AAT27937-T27989 represent novel sequences isolated from hepatitis C virus subtypes different from subtypes 1a-c, 2a-d, 3a-f, 4a-j, 5a and 6a. They sep. from the novel subtypes 1a-c, 2a-d, 2k, 2l, 3g, 4k-m, 7a-c or types 9, 10 or 11. The sequences corresp. to the 5'.

This sequence represents nucleotides 478-925 from the HCV type 10a isolate NE98. The new HCV types were isolated from patients with chronic HCV from the Benalux countries, France, Cameroon and Vietnam, because of their aberrant reactivities. The RNA was extracted, CDNA synthesised and C PCR amplified, cloned and genotyped. The 5'UR, Core/R1 and NSSB regions were sequenced either directly or partially and used to classify the new viruses into (sub)types based on comparison with known sequences. The sequences were used to generate the peptides AAR96424-R96524. The sequences can also be used to synthesise probes and primers for the detection of HCV in a sample. The polypeptides can be used to detect anticed antibodies, for HCV typing or to prevent HCV infections

Compositions comprising at least 5, and pref. 8 or more contiguous nucleotides selected from an HCV type 3 genomic sequence, more particularly (1) the region spanning positions 417-957 of the Nore Compositions 4664-4730 of the NS3 region of HCV type 3; (ii) the region spanning positions 4892-5292 of the NS34 region of HCV type 3; (iv) the region spanning positions 4892-5292 of the NS34 region of HCV type 3; (iv) the region spanning positions 8023-8235 of the NS5 region of the BR36 subgroup of HCV subtype 3 as or (v) an HCV subtype 3 cgenomic sequence, may be used as primers to amplify nucleic acid from an isolate belonging to a specific genotype, or as a probe for specific detection/classification of nucleic acid. Polypeptides encoded by the nucleotides in such compositions may be used for immunisation against HCV, for the detection of antibodies directed segion of HCV subtype 3 and is taken from a clone designated HD10-2-21. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1 AspGlyIleAsnPheAlaThrGlyAsnLeuProGlyCysSerPheSerIlePheLeuLeu

Compositions comprising at least 5, and pref. 8 or more contiguous nucleotides selected from an HCV type 3 genomic sequence, more particularly (1) the region spanning positions 417-957 of the Ne Core/El region of HCV subtype 3; (iii) the region spanning positions 4664-4730 of the NS3 region of HCV type 3; (iii) the region spanning positions 4892-5520 f the NS34 region of HCV type 3; (iv) the region spanning positions 4892-50 f the NS34 region of HCV type 3; (iv) the region spanning positions 4892-50 f the NS34 region of HCV type 3; (iv) the region spanning positions 4892-50 f the NS34 region of HCV type 3; (iv) the region spanning positions 4892-50 f the NS34 region of HCV subtype 3c genomic sequence, may be used as primers to amplify nucleic acid from an isolate belonging to a specific genotype, or as a probe for specific detection/classification of nucleic acid. Polypeptides encoded by the nucleocides in such compositions may be used for immunisation against HCV, for the detection of antibodies directed segion of HCV subtype 3a and is taken from a clone designated BR36-9-20.                                                                                                     RESULT
                                                                                                                                          ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Compositions comprising at least 5, and pref. 8 or more contiguous nucleotides selected from an HCV type 3 genomic sequence, more particularly (1) the region spanning positions 417-957 of the Core/El region of HCV subtype 3; (ii) the region spanning positions 4664-4730 of the NS3 region of HCV type 3; (iii) the region spanning positions 4892-559. Of the NS34 region of HCV type 3; (iv) the region spanning positions 8023-825 of the NS5 region of the BR36 subgroup of HCV subtype 3; or (v) an HCV subtype 3 genomic sequence, may be used as primers to amplify nucleic acid from an isolate belonging to a specific genotype, or as a probe for specific detection/classification of nucleic acid.

Polypeptides encoded by the nucleotides in such compositions may be used for immunisation against HCV, for the detection of antibodies directed segion of HCV subtype 3a and is taken from a clone designated BR33-1-10. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New polynucleotide sequences from hepatitis C virus - and related vectors, polypeptide(s) and antibodies, useful for immunisation, treatment, diagnosis and typing of HCV isolates.

Stuyver L;

```
Compositions comprising at least 5, and pref. 8 or more contiguous nucleotides selected from an HCV type 3 genomic sequence, more cucleotides selected from an HCV type 3 genomic sequence, more particularly (i) the region apanning positions 417-57 of the Core/E1 region of HCV type 3; (ii) the region spanning positions 464-4730 of the NS3 region of HCV type 3; (ii) the region spanning positions 4892-52 of the NS3/4 region of HCV type 3; (iv) the region spanning positions 8023-8235 of the NS5 region of the BR36 subgroup of HCV subtype core as a probe for specific detection/classification of nucleic acid. Properties encoded by the nucleotides in such compositions may be used for immunisation against HCV, for the detection of antibodies directed for immunisation against HCV, for the detection of antibodies directed against HCV subtype and is taken from a clone designated BR33-1-19. (Updated on 25-MAR-2003 to correct PN field.)
New polynucleotide sequences from hepatitis C virus - and related vectors, polypeptide(s) and antibodies, useful for immunisation, treatment, diagnosis and typing of HCV isolates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   G; 138 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Compositions comprising at least 5, and pref. 8 or more contiguous nucleotides selected from an HCV type 3 genomic sequence, more particularly (i) the region apanning positions 417-957 of the Core/E1 region of HCV subtype 3; (ii) the region spanning positions 4664-4730 of the NS3 region of HCV type 3; (iii) the region spanning positions 4892-529 of the NS3 region of HCV type 3; (iv) the region spanning positions 4892-529 of the NS3 region of HCV type 3; (iv) the region spanning positions 8023-8235 of the NS5 region of the BR36 subgroup of HCV subtype 3s; or (v) an HCV subtype 3c genomic sequence, may be used as primers to a sprobe for specific detection/classification of nucleic acid. Polypeptides encoded by the nucleotides in such compositions may be used for immunisation against HCV, for the detection of antibodies directed against HCV subtype 3s and is taken from a clone designated BR36-9-13. Compositions comprising at least 5, and pref. 8 or more contiguous nucleotides selected from an HCV type 3 genomic sequence, more particularly (1) the region spanning positions 417-957 of the Core/El region of HCV subtype 33, (1i) the region spanning positions 4664-4730 of the NS3 region of HCV type 3; (1ii) the region spanning positions 4692-5292 of the NS3/4 region of HCV type 3; (iv) the region spanning positions 8023-8235 of the NS5 region of the BR36 subgroup of HCV subtype 3a; or (v) an HCV subtype 3c genomic sequence, may be used as primers to amplify nucleic acid from an isolate belonging to a specific genotype, or as a probe for specific detection/classification of nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New polynucleotide sequences from hepatitis C virus - and related vectors, polypeptide(s) and antibodies, useful for immunisation, treatment, diagnosis and typing of HCV isolates.
                                                                                                                                           Hepatitis C virus, HCV; primer, probe, detection, diagnosis, classification, immunisation, prophylaxis, serotyping; ss.

```
AAT16610-T16661 are cDNAs encoding a core protein gene of 52 HCV isolates. The isolated sequences are useful for the prodn. of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the cDNAs can be used in vaccines for immunising against HCV infection. The proteins may also be used to detect antibodies against HCV in serum, saliva, lymphocytes or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DNA and amino acid sequence of HCV envelope 1 and core proteins - used to determine HCV genotype and as vaccines against HCV infection.
                                                                                                                                                                                                                                                               Polypeptides encoded by the nucleotides in such compositions may be used for immunisation against HCV, for the detection of antibodies directed against HCV and for servitying. This sequence corresponds to the Core/El region of HCV subtype 3a and is taken from a clone designated HD10-2-5. (Updated on 25-WAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                   20
                                                                                                                                                                                                                                                   AspGly11eAsnPheAlaThrGlyAsnLeuProGlyCysSerPheSerIlePheLeuLeu

AAT16610-T16661 are cDNAs encoding a core protein gene of 52 HCV isolates. The isolated sequences are useful for the prodn. of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the cDNAs can be used in vaccines for immunising against HCV infection. The proteins may also be used to detect antibodies against HCV in serum, saliva, lymphocytes or other mononuclear cells. The antibodies may be used in the prevention of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ţ

                                                                                                                                                                            AAT16610-T16661 are cDNAs encoding a core protein gene of 52 HCV isolates. The isolated sequences are useful for the prodn. of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the cDNAs can be used in vaccines for immunising against HCV infection. The proteins may also be used to detect antibodies against HCV in serum, saliva, lymphocytes or other mononuclear cells. The antibodies may be used in the prevention of

AAT16610-T16661 are cDNAs encoding a core protein gene of 52 HCV sizolates. The isolated sequences are useful for the prodn. of primers useful for detecting the presence of HCV in a sample, the primers are also useful for HCV genotyping. Proteins encoded by the cDNAs can be used in vaccines for immunising against HCV infection. The proteins any also be used to detect antibodies against HCV in serum, saliva, lymphocytes or other monouclear cells. The antibodies may be used in the prevention of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DNA and amino acid sequence of HCV envelope 1 and core proteins - used to determine HCV genotype and as vaccines against HCV infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAT12704-T12709 and AAT12961-T12974 represent hepatitis C virus (HCV) El and E2 protein coding sequence constructs. These sequences are included in vectors for the production of recombinant E1, E2, and E1/E2 proteins. The recombinant proteins can then be isolated using a method of the invention. In the method, the envelope proteins are purified by carrying out a disulphide bond cleavage, or a reduction step with a disulphide bond cleavage, or a reduction step with a disulphide containing the purified HCV envelope proteins can be used for constructs containing the purified HCV envelope proteins can be used for vaccinating humans against HCV, for in vitro detection of HCV antibodies in a sample, and in a serolyping assay for detecting one or more cerological types of HCV present in a biological sample. The constructs can also be immobilised on a soild substrate and incorporated into a reversed phase hybridisation assay for determining the presence or the genotype of HCV. The new purification method preserves the conformation of the recombinantly expressed E1, E2 and E1/E2, and eliminates contaminating proteins. Antigens isolated using this method are more reactive with human sera than those isolated by known techniques
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Purifying recombinant hepatitis C virus (HCV) El and E2 envelope proteins - in presence of di:sulphide bond cleavage agent, to produce proteins suitable for direct use in vaccines or diagnostic assays of HCV.
                                                                                                                                                                                                                                                  20

The present invention relates to new therapeutic vaccine compositions for inducing hepatitis C virus (HCV)-specific antibodies, comprising a composition contending at least one purified recombinant HCV single or specific oligomeric recombinant envelope proteins selected from an BI and an BI protein, and optionally a pharmaceutical adjuvant. The vaccines useful for inducing HCV-specific antibodies or for immunising humans against HCV. The recombinant HCV BI and/or E2 proteins are useful as vaccines or therapeutics, in HCV screening and confirmatory antibody in vitro monitoring of HCV disease or prognosing the response to treatment of patients suffering from HCV infection. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New therapeutic vaccine compositions comprising at least one purified recombinant hepatitis C virus (HCV) single or specific oligomeric recombinant envelope protein El or E2, useful for immunizing humans from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       sequence described in the exemplification of the invention
                                                                                                                                                                                                                          Hepatitis C virus, HCV, El protein, E2 protein, infection, gene, virucide, immunostimulant, vaccine, ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention comprises an Hepatitis C virus (HCV) vaccine for reducing liver disease. The vaccine of the invention comprises an HCV E1 or E2 protein as an antigen. The HCV vaccine is useful for reducing liver disease (e.g. liver fibrosis) in a chronic HCV-infected mammal. The present DNA sequence encodes an HCV E1/E2 protein.
                                                                                                                                                                                                                                                                                                                        Hepatitis C virus; HCV; vaccine; liver disease; El protein; E2 protein;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                     149

| Patent No. 6762024
| GENERAL INFORMATION:
| APPLICANT: Innogenetics N.V.
| TITLE OF INVENTION: New sequences of hepatitis C virus genotypes for diagnosis, proph)
| TITLE OF INVENTION: and therapy
| TITLE OF INVENTION: and therapy
| FILE REFERENCE: 35
| CURRENT PAPLICANT: 2001-06-12
| NUMBER OF SEQ ID NOS: 284
| SOFTWARE: Patentin version 3.1
| SEQ ID NO 25
| LENGTH: 541

Sequence 136, Application US/08290665A

Sequence 136, Application US/08290665A

Patent No. 5882852

GENERAL INFORMATION:
APPLICANT: BUCKH, J., MILLER, R.H. AND
TITLE OF INVENTION:
WUMBER OF SEQUENCES IN DIAGNOSTIC METHODS AND VACCINES

WUMBER OF SEQUENCES:
MUMBER OF SEQUENCES IN DIAGNOSTIC METHODS AND VACCINES

MUMBER OF SEQUENCES:
MUMBER OF SEQUENCES IN SETUNGAN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            573

Clones are derived from the bovine BAC library CHORI-240
(http://www.chori.org/bacpac/bovines/0.htm). For BAC library
availability, please contact Pieter de Jong (pdejong@mail.cho.org).
Clones may be purchased from BACPAC Resources
(http://www.chori.org/bacpac/ordering information.htm). This work
was undertaken as part of the International Bovine BAC Mapping
Consortium (IBBMC) by CSIRO Livestock Industries, Australia and the
British Columbia Genome Sciences Centre, Canada.

Genomic DNA was isolated from stationary phase cells. For this library, DNA was sheared to give a tight size distribution of 1-1.5kb fragments, blunt-ended with T4 DNA polymerase, dephosphorylated with Shrimp Alkaline Phosphatase and ligated into pZero-2 vector's EcoRV site."
